

Metro Ethernet

Why does my connection feel slower than usual?

This can be a tricky issue to diagnose, particularly because there are many factors that could cause a slow down in your connection. Based on reports that we receive, the most common cause of a slow-down can be high throughput utilization. That is, there is perhaps more data flowing through your internet "pipe" than can be handled. This will often cause slow speeds and dropped packets.

Other factors, such as light level issues on the fiber optic line, can contribute to this issue. Please contact us at 508-646-0030 and we will be able to check the line's statistics with an engineer to find any potential issues.

Assuming all is normal with the fiber optics, inspect your network traffic to find any systems that may be overutilizing available throughput. Such uses could be large backups, runnings, simultaneous streaming and downloading, and more.
