

Email

What are your mail server settings?

Your mail server settings will depend on your email address. Below you will find our server settings for a number of mail products we offer.

Example: user@**meganet.net** / **abcisp.net** / **empire.net** / **xpres.net**

Incoming mail server: mail.meganet.net

Outgoing mail server: smtp.meganet.net

Incoming mail server port number: 110 (POP) or 143 (IMAP)

Outgoing mail server port number: 587

For commercial accounts utilizing the IMAIL platform (not migrated in June 2019) with their own domain name, the server settings are as follows:

Example: user@**yourdomain.com**

Incoming mail server: imail.meganet.net

Outgoing mail server: imail.meganet.net

Incoming mail server port number: 110 (POP) or 143 (IMAP)

Outgoing mail server port number: 587

Please note, customers migrated in June 2019 are required to use their username@meganet.net format for logging into IMAIL. This relates to the legacy structure from the old mail server.

If you're unsure of whether to use POP or IMAP, please [take a look at this article](#), which explains the mail differences. Both POP and IMAP will work fine across our mail services. **SSL/TLS is available (incoming port: 993 for IMAP and 995 for POP, outgoing port: 465 for SMTP) and outgoing mail authentication should be enabled.** For more information on how this is done, please consult the documentation that came with your email software.

Unique solution ID: #1004
