VoIP

What is the recommended bandwidth to support Meganet's VoIP service?

First and foremost, we recommend a connection that is stable and consistent. This is required to ensure you experience good call quality. We recommend high-speed DSL, cable, or fiber connections with enough bandwidth to accomodate voice traffic, and your regular internet traffic.

Each call on the Meganet's VoIP service requires approximiately 100 Kbps of bandwidth.

Most modern, high-speed connections can easily satisfy these requirements, but please be sure to double check with your account representative or Meganet voice specialist.
